

PROOF2PAY AI

Evidence review for B2B field-service billing handoff

The problem

A technician can report an AC service job complete while the operations team still lacks the reading, customer acknowledgement, or final report needed to prepare billing. PROOF2PAY shows exactly which requirement lacks proof and who should act next.

What the MVP demonstrates

Surface	Observed result
Synthetic work order WO-1028	Starts BLOCKED with three unresolved requirements. A source-linked demo pack requires complete evidence and named human approval.
Three public NYC Parks records	Genuine source metadata is shown, but a Completed field remains INSUFFICIENT_EVIDENCE for billing.
Langflow and MCP	Four deterministic flows run locally and are exposed as MCP tools. API checks passed 13/13; direct MCP checks passed 5/5.
Local Granite Agent	The Agent graph runs through Ollama. Its final answer is source-linked by a deterministic output guard; guarded-output checks passed 5/5.

Safety and current limits

A claim is not treated as proof. Conflicts require human review; missing critical evidence blocks the pack. Bob connected to the local MCP server, but a Bob tool call is unverified. The public static browser demo and local Langflow are separate surfaces. No customer pilot, measured business uplift, invoice, or payment action is claimed.

Business hypothesis

B2B SaaS for field-service operations teams, beginning with AC/HVAC. Pricing, demand, and the best first vertical still require customer interviews.
