

# PROOF2PAY AI - Problem Validation

Secondary evidence, open hypotheses, and primary research plan

Evidence status: 27 September 2026

## Validation statement

PROOF2PAY currently has **secondary problem-category validation**. It does **not** yet have completed primary interviews, proven product-market fit, or validated pricing.

This distinction is deliberate: the project will not fabricate interview findings, user quotes, market percentages, or time savings.

## 1. Problem hypothesis

A field job can be reported complete while operations/finance still cannot safely progress to billing because required completion evidence is missing, incomplete, ambiguous, or scattered.

## 2. Evidence map

### Established FSM workflow evidence

#### ServiceTitan

Official documentation describes field-service forms that can collect **equipment details, customer signatures, checklists, photos, and PDFs**, and job closeout documentation involving required forms/signatures.

**What this supports:** completion documentation and evidence are recognized workflow objects in an established FSM product.

**What it does not support:** how often Indonesian SMEs experience delays or whether they want PROOF2PAY.

## ServiceM8

Official help documentation shows that a job marked **Completed** can move to an **Awaiting Approval** stage where materials and invoice details are checked before approval/synchronization.

**What this supports:** completion and invoice approval can be distinct states.

ServiceM8 also documents customer signature capture as confirmation that a job has been completed.

## 3. Indonesian contextual evidence

### BAST definition

JDIH Kementerian Keuangan defines BAST, in cited regulatory contexts, as a legal document for handover of completed work from provider to employer.

### SIPLah

Official SIPLah guidance describes validating/finalizing an order so BAST can be produced and then proceeding to payment steps.

**Important limitation:** these are public-sector/procurement contexts. They demonstrate the importance of formal handover evidence in those contexts; they do **not** mean every private B2B field-service job requires BAST.

## 4. Validation table

| Question                                                                     | Current evidence                       | Status                      |
|------------------------------------------------------------------------------|----------------------------------------|-----------------------------|
| Does completion evidence matter in field service?                            | ServiceTitan / ServiceM8 official docs | <b>Supported</b>            |
| Can completion and invoice approval be separate states?                      | ServiceM8 Awaiting Approval            | <b>Supported</b>            |
| Are signatures/photos/forms common workflow artifacts?                       | ServiceTitan / ServiceM8               | <b>Supported</b>            |
| Can formal handover evidence precede payment in Indonesian public workflows? | JDIH Kemenkeu / SIPLah                 | <b>Supported in context</b> |

| Question                                                | Current evidence                       | Status             |
|---------------------------------------------------------|----------------------------------------|--------------------|
| How frequently does this pain occur in Indonesian SMEs? | No credible direct evidence identified | <b>Unvalidated</b> |
| Average delay / admin time?                             | No segment-specific credible dataset   | <b>Unvalidated</b> |
| Willingness to pay?                                     | Not researched directly                | <b>Unvalidated</b> |
| Best starting vertical?                                 | Product hypothesis: HVAC               | <b>Unvalidated</b> |

## 5. Product insight from competitor evidence

Because established FSM tools already support forms, photos, signatures, and invoicing, PROOF2PAY should **not** be pitched as “we digitize checklists”.

The differentiation hypothesis is:

1. understand mixed/unstructured evidence;
2. connect each requirement to supporting proof;
3. explicitly identify unsupported or ambiguous completion claims;
4. explain critical blockers;
5. orchestrate the next action;
6. work as an overlay rather than require replacement of the full stack.

## 6. Primary research plan

Minimum initial target: five interviews within one technical-service vertical.

Key questions:

1. Tell me about the last completed job that was not immediately ready to invoice.
2. What prevented billing?
3. Which proof/documents had to be complete?
4. Who followed up on missing evidence?
5. How long did it take?
6. How often has this happened recently?
7. What was the impact?
8. Which tools were involved?
9. What was most frustrating?
10. After the workflow is understood, what part of PROOF2PAY is valuable or unnecessary?
