

PROOF2PAY AI - User Flow

From reported complete to evidence-backed billing readiness

Golden Path: WO-1028

Golden user flow

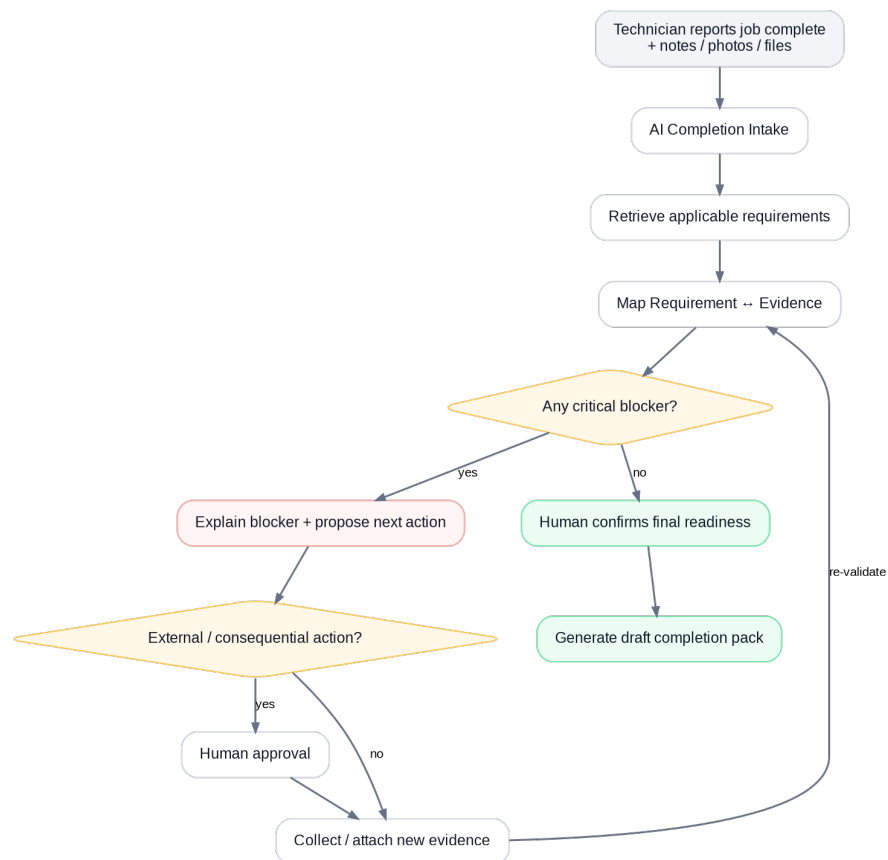

Figure 1: User flow

Stage 1 - Job reported complete

Technician submits a short completion note and available evidence.

Example:

“Preventive maintenance lantai 2 selesai. Filter dan drain dibersihkan, unit diuji setelah service.”

Attachments in the synthetic demo include before/after photo metadata and a partial test note.

Stage 2 - AI completion intake

The system separates:

- **facts** directly present in controlled/job data;
- **claims** stated by the technician;
- **evidence** files/records that may support a claim;
- **missing input** needed to proceed.

A claim is not automatically treated as proof.

Stage 3 - Requirement retrieval

PROOF2PAY retrieves the controlled completion requirements for this job/service template.

Synthetic examples:

- before-service documentation;
- after-service documentation;
- post-service cooling-performance evidence;
- customer completion acknowledgement;
- final service report.

Stage 4 - Evidence validation

The engine maps each requirement to candidate evidence and assigns one of:

READY / MISSING / INCOMPLETE / AMBIGUOUS / HUMAN_REVIEW

Stage 5 - Explain blockers

WO-1028 starts as **BLOCKED** because:

1. customer acknowledgement is missing;
2. cooling-test proof is ambiguous;

3. final service report is missing.

The user can open each blocker to see the source requirement, available evidence, and reason.

Stage 6 - Gap-to-action

The agent recommends the smallest next step:

- customer acknowledgement -> prepare a sign-off request;
- ambiguous cooling test -> request measurable post-service reading from technician;
- report missing -> prepare draft only after facts are verified.

Stage 7 - Approval

If an action communicates externally or changes a consequential workflow, Bob asks the user to approve.

Stage 8 - Evidence update & re-validation

New evidence is attached, then only affected requirements need re-checking.

Stage 9 - Final human confirmation

After all critical requirements are **READY**, the user confirms that the job can move to billing-ready state.

Stage 10 - Completion pack

The system generates a **draft** package containing:

- job summary;
- verified completion facts;
- requirement/evidence matrix;
- service report draft;
- handover/BAST draft when applicable to the workflow;
- evidence manifest;
- audit/approval summary.

PROOF2PAY does not autonomously issue an invoice or move money.

UX acceptance criteria

- A first-time user understands *why* the job is blocked within 10 seconds of opening Job Detail.
- Every critical blocker is actionable.
- Human approval is explicit.
- Conceptual progress score never masks critical blockers.
- The system can explain what changed after new evidence is attached.
